

SLA-Guided Data Integration on Multi-cloud Environment

Challenges:

- Which services should I select ? Are the requirements being respected?
 - How to be sure that all SLAs are being respected?
 - How to integrate different SLAs associated to services involved with user's preferences?
 - How results can be reused for a next query?
- The objective is to propose a data integration solution in a multi-cloud environment guided by user preferences and SLA exported by different clouds.
